

## ABSTRACT

A particulate containing a pantethine, a light anhydrous silicic acid and a microcrystalline cellulose, in which the total content of the light anhydrous silicic acid the microcrystalline cellulose amounts to a quantity that yields a 0.6 or higher adsorptivity. The present pantethine-containing particulate has a good flowability and an adequate particle size providing excellent handling properties. It is free from impediments such as blocking, and has a good storage stability.
